FILE 'CAPLUS' ENTERED AT 08:54:46 ON 06 JUL 2001 USE IS SUBJECT TO THE TERMS OF YOUR STN CUSTOMER AGREEMENT. PLEASE SEE "HELP USAGETERMS" FOR DETAILS. COPYRIGHT (C) 2001 AMERICAN CHEMICAL SOCIETY (ACS)

Copyright of the articles to which records in this database refer is held by the publishers listed in the PUBLISHER (PB) field (available for records published or updated in Chemical Abstracts after December 26, 1996), unless otherwise indicated in the original publications.

FILE COVERS 1947 - 6 Jul 2001 VOL 135 ISS 3 FILE LAST UPDATED: 5 Jul 2001 (20010705/ED)

This file contains CAS Registry Numbers for easy and accurate substance identification.

This file supports REG1stRY for direct browsing and searching of all substance data from the REGISTRY file. Enter HELP FIRST for more information.

CAplus now provides online access to patents and literature covered in CA from 1947 to the present. On April 22, 2001, bibliographic information and abstracts were added for over 2.2 million references published in CA from 1947 to 1966.

The CA Lexicon is now available in the Controlled Term (/CT) field. Enter HELP LEXICON for full details.

Attention, the CA Lexicon is the copyrighted intellectual property of the American Chemical Society and is provided to assist you in searching databases on STN. Any dissemination, distribution, copying, or storing of this information, without the prior written consent of CAS, is strictly prohibited.

PRIORITY APPLN. INFO.:

US 1995-392542 A2 19950216 WO 1996-US1535 W 19960216

The present invention provides peptides and peptidomimetics corresponding AΒ to part or to the entirety of the region encompassed by residues 360-386 of human p53, said peptides and peptidomimetics characterized by the ability to activate DNA binding of wild-type p53 and to select tumor-derived p53 mutants. Pharmaceutical compns. of the compds. of the invention and methods of using these compns. therapeutically are also

PRIORITY APPLN. INFO.:
     Recombinant fragments of Factor C are disclosed. These proteins and
     peptides show great potency in recognizing, binding to, neutralizing, and
     removing endotoxin. These mols. can thus be used for anti-microbial,
     anti-endotoxin, and anti-sepsis therapy. SSCrFCES is a 38 kDa protein
     representing the LPS-binding domain of Factor C. The ability of SSCrFCES
     to bind lipid A was analyzed using an ELISA-based assay as well as surface
     plasmon resonance. Surface plasmon resonance similarly carried out for
     SSCrFC-sushi-1,2,3-GFP, SSCrFC-sushi-1-GFP, and SSCrFC-sushi-3-GFP
     confirmed their superior affinity for endotoxin. The 50 \mbox{\%}
     endotoxin-neutralizing concn. of SSCrFCES against 200 EU of endotoxin is
     0.069 .mu.M, suggesting that SSCrFCES is an effective inhibitor of Limulus
     amoebocyte lysis coagulation cascade. Although partially attenuated by
     human serum, as low as 1 .mu.M of SSCrFCES inhibits the LPS-induced
     secretion of hTNF-.alpha. and hIL-8 THP-1 and human peripheral blood
     mononuclear cells with a potency more superior than polymyxin B. SSCrFCES
     is non-cytotoxic, with a clearance rate of 4.7 mL/min. The LD90 of
     SSCrFCES for LPS lethality in mice is achieved at 2 .mu.M. These results
     demonstrate the endotoxin-neutralizing capability of SSCrFCES in vitro and
     in vivo, as well as its potential for use in the treatment of
     endotoxin-induced septic shock. Also embodied in this application is the
     use of the sushi peptides and their mutant derivs. as potent
     antimicrobials. Further embodied in this application is the use of sushi
     peptides or sushi recombinant proteins to remove endotoxin from liqs.

cause global neurodegenerative disease. Representative examples include the infantile and late infantile forms of the ceroid lipofuscinoses (CLN1 or CLN2 deficiency, resp.) and mucopolysaccharidoses type VII (MPS VII), a deficiency of .beta.-glucuronidase. Treatment of the central nervous system component of these disorders will require widespread protein or enzyme replacement, either through dissemination of the protein or through dissemination of a gene encoding it. We hypothesize that transduction of brain microcapillary endothelium (BME) with recombinant viral vectors, with secretion of enzyme product basolaterally, could allow for widespread enzyme dissemination. To achieve this, viruses should be modified to target the BME. This requires (i) identification of a BME-resident target receptor, (ii) identification of motifs targeted to that mol., (iii) the construction of modified viruses to allow for binding to the target receptor, and (iv) demonstrated transduction of receptor-expressing cells. In proof of principal expts., we chose the human transferrin receptor (hTfR), a mol. found at high d. on human BME. A nonamer phage display library was panned for motifs which could bind hTfR. Forty-three clones were sequenced, most of which contained an AKxxK/R, KxKxPK/R, or KxK motif. Ten peptides representative of the three motifs were cloned into the HI loop of adenovirus type 5 fiber. All motifs tested retained their ability to trimerize and bind transferrin receptor, and seven allowed for recombinant adenovirus prodn. Importantly, the fiber-modified viruses facilitated increased gene transfer (2- to 34-fold) to hTfR expressing cell lines and human brain microcapillary endothelia expressing high levels of endogenous receptor. Our data indicate that adenoviruses can be modified in the HI loop for expanded tropism to the hTfR.

Development of nonviral delivery systems is progressing toward a transfection efficiency sufficient to affect metabolic and neoplastic diseases in humans. Nevertheless, inadequate transfection efficiency of target cells with current nonviral systems still limits the utility of this therapy. In the current study, we have detd. that a co-polymer of histidine and lysine (H-K) enhances the transfection efficiency of liposomes, a leading nonviral system. We found that in the absence of serum, the addn. of this polymer increased transfection as much as 10-fold

in comparison with the liposome: DNA complex alone. More impressively, the co-polymer in the presence of serum increased transfection efficiency up to 100-fold. Furthermore, in vivo expression of luciferase in a tumor increased 15-fold with the addn. of H-K polymer to the liposome:plasmid DNA complexes. Without liposomes, the H-K polymer had little to no effect on transfection efficiency. We anticipate that further modifications of this co-polymer will yield mols. with both increased complexity and transfection efficiency.

AB The acetyl-TESHHK-amide peptide, modeling a part of the C-terminal "tail" of histone H2A, was found previously by us to undergo at pH 7.4 a Ni(II)-assisted hydrolysis of the E-S peptide bond with formation of a stronger Ni(II) complex with the SHHK-amide product (1998). To further characterize the hydrolysis and test the resulting Ni(II) complex for redox activity, bovine histone H2A and three peptides were investigated: acetyl-LLGKVTIAQGGVLPNIQAVLLPKKTESHHKAKGK (H2A34), modeling the entire "C-tail" of H2A; SHHKAKGK (H2A8), modeling the cutoff product of hydrolysis; and acetyl-KTESHKAKGK (H2A10), modeling a putative Ni(II) binding site in a minor variant H2A.4 of human histone H2A. Ni(II)-assisted hydrolysis of H2A and H2A34 was found to proceed approx. 7-fold faster than that of the Ni(II)-acetyl-TESHHK-amide complex under comparable conditions. In both cases, the Ni(II) complex with H2A8 was the smaller product of the hydrolysis, indicating a high site specificity of the reaction. Of three other metals tested with H2A34, only Cu(II) cleaved the E-S bond, although much less efficiently than Ni(II); Co(II) and Zn(II) had no effect whatsoever. The H2A10 peptide appeared to be fully resistant to hydrolytic cleavage and did not exhibit any redox activity vs. H2O2 in the presence of Ni(II) at pH 7.4. Likewise, redox-inactive was the Ni(II)-H2A34 complex. In contrast, the Ni(II)-H2A8 complex promoted oxidative damage of pUC19 DNA by H2O2, evidenced by a significant increase in the no. of single strand breaks and nucleobase modifications typical for a hydroxyl radical-like species attack on DNA. Interestingly, instead of 8-oxopurines, the corresponding formamidopyrimidines were the major products of the damage. difference in redox activity between the Ni(II)-H2A34 and Ni(II)-H2A8 complexes is most likely assocd. With their different geometries: octahedral and square planar, resp. Incubation of the Ni(II)-H2A8 complex with H2O2 also resulted in degrdn. of the peptide ligand, esp. at its Ser and His residues. Thus, binding of Ni(II) to the ESHHK motif of the histone H2A C-tail is damaging to the histone C-terminal tail and to histone-assocd. DNA. The results support a dual mechanism of Ni(II)-induced carcinogenesis, including both genotoxic and epigenetic effects.

The hepatitis B virus core antigen (HBcAg) is a promising protein carrier for exposing the epitopes of various human and animal pathogens. HBcAq-based chimeric proteins can be used in creating highly efficient vaccines; however, not all chimeric HBcAg with foreign epitope inserts are capable of assembly into virus-like particles. Using computer programs ProAnalyst, SALIX, and QSARPro, the authors examd. the relation between the self-assembly capability of chimeric HBcAg and the physicochem. properties of the inserts. The self-assembly was impaired when the inserted peptides contained highly hydrophobic and bulky residues tending to form .beta.-structures; this esp. concerned the C-proximal residues in the insert. Recommendations were elaborated for constructing foreign epitopes that would ensure correct self-assembly of chimeric HBcAq particles.

Autoantibodies and autoreactive T lymphocytes directed against several pancreatic .beta. cell proteins such as GAD65 have been identified in the circulation before and at the onset of clin. type 1 (insulin-dependent) diabetes. Using GAD65 synthetic peptides, the authors studied the

proliferative response of peripheral blood mononuclear cells (PBMC) either from recently diagnosed type 1 diabetic patients, of whom the majority share the disease-assocd. HLA class II haplotype (DR4-DQB1*0201 or DR3-DQB1*0302), or from HLA-matched control subjects. The authors found that 67% (14/21) of the type 1 diabetic patients and 39% (9/23) of the control subjects exhibited a pos. proliferative response. Compared with control subjects, however, PBMC from diabetic patients proliferated more frequently in the presence of peptide pools from the C-terminal region of GAD65 (amino acids 379-585). Diabetic patients with the same HLA-DQ or HLA-DR alleles showed partially identical T cell reactivity, but no clear correlation could be made between MHC class II specificity and T cell epitopes because of multiple combinations of class II alleles. by flow cytometry, the authors studied the direct binding of GAD65 peptides to MHC class II mols. of Epstein-Barr virus (EBV)-transformed B (EBV-B) cells obtained from a diabetic patient. They found that 11 GAD peptides were able to bind to the highly susceptible haplotype DRB1*0301/0401-DQA1*0301/0501-DQB1*0302/0201 on the surface of EBV-B cells in partial correlation with the results obtained in the proliferation assays.

SOURCE:

Two smooth muscle myosin heavy chain isoforms differ by a 7-amino-acid AB insert in a flexible surface loop located near the nucleotide binding site. The non-inserted isoform is predominantly found in tonic muscle, while the inserted isoform is mainly found in phasic muscle. The inserted isoform has twice the actin-activated ATPase activity and actin filament velocity in the in vitro motility assay as the non-inserted isoform. We used the laser trap to characterize the mol. mechanics and kinetics of the inserted isoform ((+)insert) and of a mutant lacking the insert ((-)insert), analogous to the isoform found in tonic muscle. The constructs were expressed as heavy meromyosin using the baculovirus/insect cell system. Unitary displacement (d) was similar for both constructs (.apprx. 10 nm) but the attachment time ton for the (-)insert was twice as long as for the (+)insert regardless of the [MgATP]. Both the relative av. isometric force (Favg(-insert)/Favg(+insert)) = 1.1.+-.0.2 (mean .+-. SE) using the in vitro motility mixt. assay, and the unitary force (F .apprx. 1 pN) using the laser trap, showed no difference between the two constructs. However, as under unloaded conditions, ton under loaded conditions was longer for the (-)insert compared with the (+)insert construct at limiting [MgATP]. These data suggest that the insert in this surface loop does not affect the mechanics but rather the kinetics of the cross-bridge cycle. Through comparisons of ton from d measurements at various [MgATP], we conclude that the insert affects two specific steps in the cross-bridge cycle, i.e., MgADP release and MgATP binding.

Assay methods for detq. the presence of the brain protein S-100 in a clin. AB sample which use antibodies directed to epitopes in the region from Serl . to Asn38 and from Thr82 to Glu93 of the amino acid sequence of the .beta. subunit of human S100B is provided. The methods developed include luminescent immunoassay, ELISA, and IRMA, and is used for detecting cerebral dysfunction, melanoma cancer, and for evaluating the influence of extracorporal circulation equipment on injured brain.

mutase (E.C. 5.4.2.1.) of birch, mugwort and timothy grass pollen are cloned and characterized. This sequence of the allergen is highly conserved in all plants, but not in animals. The amino acid sequence and the most important B and T cell epitopes of the mol. are derived and demonstrated. The allergen was manufd. in E. coli and bound the IgE serum of patients who are allergic to tree, grass and weed pollens and various foodstuffs. A monoclonal antibody (BIP 3) specifically binds to this protein from all plants tested. The significance of the co-factor-independent phosphoglycerate mutase (E.C. 5.4.2.1.) derives from the fact that it results in the cross-sensitization of patients. The

protein and peptide fragments can be used in diagnostic and therapeutic methods based, for example, on antigen -antibody interaction, mediator release or T-cell reactivity.

AB A synthetic peptide vaccine of the general sequence Cys-Cys-(200-213)-Pro-Pro-Ser-(141-158)-Pro-Cys-Gly(peptide A40), where the numbered residues refer to the VP1 sequence of foot-and-mouth disease virus (FMDV) strain A24 Cruzeiro, has previously been shown to elicit neutralizing and protective antibodies in guinea-pigs and cattle. To examine this immunogenic tract in more detail monoclonal antibodies (MAbs) were raised to this peptide. One such MAb, C1.1, which recognized the homologous peptide, bound to native virus, neutralized infectivity in vitro and passively protected mice from challenge. Using overlapping dodecameric peptides the min. binding 'footprint' of this MAb incorporated residues 149-154 which were resp. Gly-Ser-Leu-Ala-Ala-Arg. Since this 'footprint' occurs in several other A subtype strains of FMDV, the extent to which MAb C1.1 could cross-react was also examd. Using a liq.-phase competition ELISA, only viruses with a sequence that encompassed the same min. binding 'footprint', namely A27 Cundinamarca Colombia/76, A Argentina/79, and A Venceslau Brazil/76 reacted with similar affinity against MAb C1.1. However, further serol. examn. of Cl.1 with these viruses by indirect ELISA, in vitro neutralization and passive protection showed clear functional disparity. In contrast to the lig.-phase ELISA, the ability of C1.1 to react with electrostatically bound virus varied significantly depending on the subtype examd. Moreover, the capacity of this MAb to neutralize these subtypes showed wide divergence which was mirrored by the protection data.

AB The pathogenic potential of autoimmune T cell responses to nonmyelin autoantigens was investigated in the Lewis rat using the astrocyte-derived calcium binding protein S100.beta., as a model nonmyelin autoantigen. The

Robinson 09/437912

Lewis rat mounts a vigorous RT1B (major histocompatibility complex class II) restricted autoimmune response to an immunodominant S100.beta. epitope (amino acid residues 76-91). The adoptive transfer of S100.beta.-specific T cell lines induced a severe inflammatory response in the nervous system, but only minimal neurol. dysfunction in naive syngeneic recipients. The inability of S100.beta.-specific T cell transfer to induce severe disease was assocd. with a decreased recruitment of ED1+ macrophages into the central nervous system (CNS) in comparison with that seen in severe exptl. autoimmune encephalomyelitis (EAE) induced by the adoptive transfer of myelin basic protein (MBP)-specific T line cells. Moreover, unlike encephalitogenic MBP-specific T lines, S100.beta.-specific T cell lines exhibited no cytotoxic activity in vitro. Histopathol. anal. also revealed striking differences in the distribution of inflammatory lesions in MBP- and S100.beta.-specific T cell-mediated disease. In contrast to the MBP paradigm, S100.beta.-specific T cell transfer induces intense inflammation not only in the spinal cord, but throughout the entire CNS and also in the uvea and retina of the eye. In view of the distribution of lesions throughout the gray and white matter of the CNS the authors propose to term this new model exptl. autoimmune panencephalomyelitis (EAP) to differentiate at from EAE. These expts. demonstrate for the first time that nonmyelin CNS autoantigens can initiate a pathogenic autoimmune T cell response, although the nature of the target autoantigen profoundly influences the clin. and histopathol. characteristics of the resulting autoimmune disease. This is not simply a consequence of the distribution of the autoantigen, as both MBP and S100.beta. are coexpressed in many areas of the CNS, but reflects differences in the capacity of different regions of the CNS to process and present autoantigens. This new model of T cell-mediated autoimmune CNS disease exhibits a no. of similarities to multiple sclerosis (MS), such as its mild clin. course and the involvement of areas of the brain and eye, which are absent in myelin-mediated models of EAE. Nonmyelin autoantigens may therefore play an unexpectedly important role in the immunopathogenesis of inflammatory diseases of the CNS.

TITLE:

Neutralizing epitopes of type O foot-and-mouth disease virus. II. Mapping three conformational sites with

synthetic peptide reagents

Parry, N. R.; Barnett, P. V.; Ouldridge, E. J.; Rowlands, D. J.; Brown, F. AUTHOR(S):

Dep. Virol., Wellcome Biotechnol. Ltd., CORPORATE SOURCE:

Beckenham/Kent, BR3 3BS, UK J. Gen. Virol. (1989), 70(6), 1493-503

CODEN: JGVIAY; ISSN: 0022-1317

DOCUMENT TYPE: Journal LANGUAGE: English

Four neutralizing monoclonal antibodies (MAbs), recognizing 3 functionally independent, conformational sites on type O foot-and-mouth disease virus (FMDV) failed to react with immobilized structural proteins or synthetic peptides but bound to the isolated capsid protein VP1 and peptides in soln. Inhibition ELISA techniques were, therefore, applied using peptide antigens and anti-peptide sera to block MAb binding to virus particles, permitting the identification of those portions of the VP1 protein contributing to the epitopes. The binding site of one MAb, which neutralized a range of type O FMDV isolates, was shown to have components within regions 146-150 and 200-213 of VP1 with a crit. involvement of the amino acids at positions 146 and 206 or 207. The determinants recognized by 2 other MAbs which were directed at similar, but not identical, epitopes from a second site included components from the 200 to 213 and 143 to 146 regions with amino acids 143 and 144, resp., being crit. for the inhibition of the virus binding of the 2 antibodies. Thus, the 2 previously identified immunogenic tracts of VP1 are brought into proximity in the quaternary structure of the virion to form an antigenic domain contg. several conformational epitopes, some of which are functionally independent. A fourth, strain-specific MAb was effectively blocked from reacting with virus by peptides corresponding to residues 161-180 and 200-213.

English LANGUAGE:

(.+-.)-7r,8t-Dihydroxy-9t,10t-oxy-7,8,9,10-tetrahydrobenzo[a]pyrene (DPBE-I) binding was compared in 3 vertebrate histones H2A with different C-terminal regions. HPLC analyses of core histones prepd. from nuclei exposed to [3H]BPDE-I showed that rat liver and chicken erythrocyte histones H2A were heavily labeled by [3H]BPDE-I, but Xenopus laevis liver histone H2A was not. This result was confirmed by HPLC analyses of V8-protease digests of BPDE-I bound to histone H2A purified from the 3 different nuclei. There are significant amino acid sequence differences only in the C-terminal regions of the different histones H2A, where rat liver and chicken erythrocyte histones H2A contain 2 and 1 histidine residues, resp., while the amino acid sequence of Xenopus histone H2A contains no histidine. Pre-treatment of the in situ BPDE-I-modified H2A.2 from rat liver with carboxypeptidase B, which should remove the C-terminal lysine from the protein, resulted in increased retention times on reverse-phase HPLC for the adduct-contg. peptides upon subsequent

V8-protease digestion. This suggested that the site(s) of BPDE-I modification are located primarily in the C-terminal octapeptide of rat H2A.2. To confirm this, C-terminal V8-peptides of the different histones H2A were isolated and reacted with BPDE-I at physiol. pH in vitro. The HPLC analyses of the reaction mixts. indicated that the C-terminal peptide of rat liver and chicken erythrocyte histones H2A was a target site for BPDE-I binding in nuclei. Thus, the nucleophilic target amino acid for BPDE-I binding in histone H2A may be a histidine located close to the C terminus.

AB The presence of sequences of peptide bioregulators fragments in blood proteins and their potential release following degrdn. of the proteins by enzymes present in circulating blood were discussed. E.g., the tuftsin analog His, Lys, Pro [97461-89-7] was found in fragment 535-538 of serum albumin and could be released by plasmin. The enkephalin analog Tyr-Gly-Phe-Tyr [97461-90-0] could be released from the .beta.-chain of fibrinogen by plasmin, esterase, and exopeptidase. The angiotensin analogs Glu-Glys-Ile-Tyr-Ile-His-Pro-Arg [97474-91-4] and Glu-Lys-Ile-Tyr-Ile-His-Pro-Arg-Tyr [97461-88-6] were released from fragments 405-412 and 405-413 of prothrombin [9001-26-7]. stabilities of the conformational analogs of these bioregulator peptides were given and related to potential bioacty.

AB A procedure is described for rapid concurrent synthesis on solid supports of hundreds of peptides, of sufficient purity to react in an ELISA. Interaction of synthesized peptides with antibodies is then easily detected without removing them from the support. In this manner, an immunogenic epitope of the immunol. important coat protein of foot-and-mouth disease virus (type O1) was located with a resoln. of 7 amino acids, corresponding to amino acids 146-152 of that protein. Then, a complete replacement set of peptides in which all 20 amino acids were substituted in turn at every position within the epitope was synthesized, and the particular amino acids conferring specificity for the reaction with antibody were detd. The leucine residues at positions 148 and 151 were essential for reaction with antisera raised against intact virus. lesser contribution was derived from the glutamine and alanine residues at positions 149 and 152, resp. Aside from the practical significance for locating and examg. epitopes at high resoln., these findings may lead to better understanding of the basis of antigen-antibody interaction and antibody specificity.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                              Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq length: 0 seq length: 2000000000

The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the compostion may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis
                                                                                            A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis
                                                                                                                                                                  McCrae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising part or all of the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and oversity and the states are the states.

The present sequence represents a fragment of the light chain of huma high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant pentides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin.
                                                                                                                                                               Claim 3;

                                  The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to

Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting

The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting endothelial cell proliferation.
                                     A wound treating agent contg. a partial peptide of kininogen have growth promotion activity of fibroblasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains.

                                          The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit of angiogenesis. The compounds can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fragment 1.2, amino acids 390-520. Partial peptides of bovine and human kininogen fragment 1.2, a maino acids 390-520. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activion of fibroblasts.

                                                     The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can base be inhibiting endothelial cell proliferation. The compounds can also be

                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                   The present sequence represents the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
Partial peptide of HMW kininogen fragment 2

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a mathematical contraction of the method of the invention.

The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can esd for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                Score

It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is derived from human two-chain high molecular weight kininogen (HKa) domain 5. HKa is product of high molecular weight kininogen (HK) cleavage by plasma kallikrein. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Anglogenesis occurs in a number of disease states, such as tumour formation and composition for inhibiting anglogenesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                     high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis
                                                                                                                                                                                                                                                                                                                    A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; high molecular weight kininogen; HK;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       residues 402-498 of the human high polymer quininogen L-chain. They are useful in cell adhesion, cancer metastasis or platelet aggregation inhibitors, and in wound, inflammatory disease, arteriosclerosis or glomerular nephritis treating agents. The present peptide was synthesised using a solid phase method, and purified using a YMC-DOS-120A-S15/13 column.
                                                                                                                                                                                                                    The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with
                                                                                                                                                                                                   high affinity to endothelial cells, where it is cleaved to two-chain

                                                                                                                        The present sequence represents a fragment of the light chain of human high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used to the thirt fraction of pagingers in the compounds can also be used to the thirt fraction of pagingers.

                                                                                                                                                                                                                                         The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting anglogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsus. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting analogues. The method and the compounds can be used for
Method for inhibiting endothelial cell proliferation, that inhibit endothelial cell migration -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

                                                                                                                        AAR75181 is a partial peptide corresponding to human kininogen fragment 1.2, amino acids 390-520. Partial peptides of bovine and human kininogen fragments 1.2, I and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity.
                                                                                                                                                                                                                                                           \boldsymbol{A} wound treating agent contg. a partial peptide of kininogen have growth promotion activity of fibroblasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibition analogues.

                                                                                                                                 The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used to used for inhibiting angiognesis. The compounds can also be used to

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to

                                                                                                                                        The patent discloses a method for preventing or treating a disorder resulting from the release of bradykinin in a mammal which produces a heparin-binding protein (HBP) that binds to a HBP antagonist. This method involves administration of a mammalian HBP antagonist (especially aprotinin) and/or monoclonal antibodies that bind to prekallikrein-H kininogen complexes in the HBP, to decrease the release of bradykinin in the mammal. The antagonists of HBP (e.g. aprotinin) decrease the permeability of the endothelial cells and are used to prevent or treat disorders resulting from the release of bradykinin such as systemic inflammatory response syndrome, ischaemia reperfusion, anaphylaxis and/or allograft rejection. They are also used to treat adult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-APR-1999;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is derived from human two-chain high molecular weight kininogen (HKa) domain 5. HKa is product of high molecular weight kininogen (HKa) cleavage by plasma kallikrein. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells. Hka cor a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and cryological cexpansion, and certain ocular disorders. It can also occur in a crheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell composis. Peptides used in the composition may be recombinant peptides, or synthesis expansion, and so be chemically construction by inducing endothelial cell proliferation or by inducing endothelial cell composis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically construction by inducing endothelial cell construction by inducing endothelial cell composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically construction by inducing endothelial cell construction by inducing endot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain occular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis

                                                                                                                                                                                                                                                                                                                                The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 11; Page 40-41; 41pp; English.
